

Update guide

Make sure you have read and understood the [Release Notes](#) before performing any updates!

Interactive update

1. Backup

Make a backup copy of your whole 'nconf/' folder and create a dump of your 'nconf' database.

The update process will not overwrite your configuration, but if you have made changes to any other files, these changes will be lost! This is also true for icons that you might have installed manually ('img/logos/base/').

Commandline example:

```
1 | cp -rp nconf/ nconf.BAK
2 | mysqldump -u DBUSER -p DBNAME > nconf-dbdump.sql
```

2. Download and unpack

Download the NConf archive. If you have console access, upload the uncompressed archive to your server and uncompress it to a temporary location.

Commandline example:

```
1 | tar -zxf nconf-VERSION.tgz -C /tmp/
```

Another option is to uncompress the archive on your local PC, then upload all the files with an [FTP](#) account to your webserver.

3. Update existing files

Copy the unpacked files to the 'nconf/' folder and overwrite any existing files of your current NConf installation. You may do this using the console or by uploading the new files directly via [FTP](#) to the 'nconf/' folder.

Commandline example:

```
1 | /bin/cp -rv /tmp/nconf/* /path/to/nconf/ (specify the full path to the 'cp' binary)
```

This step cannot be undone! Make sure you have made a backup of your 'nconf/' folder.

4. Check permissions

Make sure the following directories are still writable to your webserver user.

You can change permissions on the console or via [FTP](#) client (CHMOD)

```
1 | ./config
2 | ./output
3 | ./static_cfg
4 | ./temp
```

5. Begin interactive update

Using your browser, start the update process by navigating to <http://www.mydomain.com/nconf/UPDATE.php> [<http://www.mydomain.com/nconf/UPDATE.php>]

The the exact URI will depend on your webserver configuration.

It could also be something like this: <http://nconf.mydomain.com/UPDATE.php> [<http://nconf.mydomain.com/UPDATE.php>]

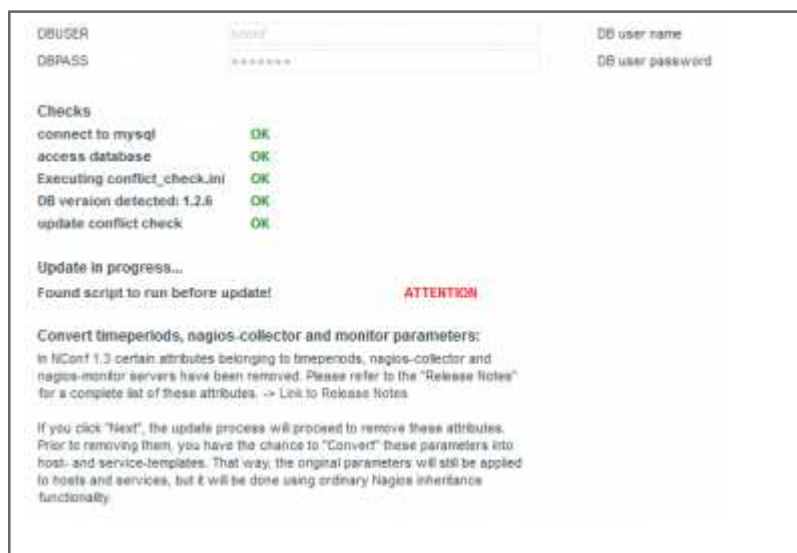

Pre-update check

 <p>Welcome to NConf setup This will install NConf version "1.3.0" The pre-installation check will test your system for NConf.</p> <p>Requirements</p> <table><tr><td>PHP 5.0 (or higher) -> 5.2.9</td><td>OK</td></tr><tr><td>MySQL 5.0.2 (or higher) -> 5.1.32</td><td>OK</td></tr><tr><td>PHP-MySQL support</td><td>OK</td></tr><tr><td>Perl 5.6 (or higher) -> 5.8.8</td><td>OK</td></tr></table>	PHP 5.0 (or higher) -> 5.2.9	OK	MySQL 5.0.2 (or higher) -> 5.1.32	OK	PHP-MySQL support	OK	Perl 5.6 (or higher) -> 5.8.8	OK	<p>The pre-update check will try to detect some requirements. If all checks are OK, you may safely proceed with the update.</p> <p>If one or more checks fail, you may still proceed to update NConf, but it might not work properly</p>
PHP 5.0 (or higher) -> 5.2.9	OK								
MySQL 5.0.2 (or higher) -> 5.1.32	OK								
PHP-MySQL support	OK								
Perl 5.6 (or higher) -> 5.8.8	OK								

Version detection

 <p>IL database configuration : enter the DB information for NConf installation.</p> <table><tr><td>ST</td><td>localhost</td><td>DB server</td></tr><tr><td>ME</td><td>nconf</td><td>DB name</td></tr><tr><td>ER</td><td>nconf</td><td>DB user nam</td></tr><tr><td>SS</td><td></td><td>DB user pass</td></tr></table> <p>KS</p> <table><tr><td>ct to mysql</td><td>OK</td></tr><tr><td>s database</td><td>OK</td></tr><tr><td>ting conflict_check.ini</td><td>OK</td></tr><tr><td>rsion detected: 1.2.6</td><td>OK</td></tr><tr><td>a conflict check</td><td>OK</td></tr></table> <p>e proceed to update</p>	ST	localhost	DB server	ME	nconf	DB name	ER	nconf	DB user nam	SS		DB user pass	ct to mysql	OK	s database	OK	ting conflict_check.ini	OK	rsion detected: 1.2.6	OK	a conflict check	OK	<p>Check the database information. It should be predefined correctly.</p> <p>The update process will then detect your NConf version and will perform an update of your database.</p>
ST	localhost	DB server																					
ME	nconf	DB name																					
ER	nconf	DB user nam																					
SS		DB user pass																					
ct to mysql	OK																						
s database	OK																						
ting conflict_check.ini	OK																						
rsion detected: 1.2.6	OK																						
a conflict check	OK																						

Update to 1.3.0

 <p>DBUSER: nconf DB user name DBPASS: ***** DB user password</p> <p>Checks</p> <table><tr><td>connect to mysql</td><td>OK</td></tr><tr><td>access database</td><td>OK</td></tr><tr><td>Executing conflict_check.ini</td><td>OK</td></tr><tr><td>DB version detected: 1.2.6</td><td>OK</td></tr><tr><td>update conflict check</td><td>OK</td></tr></table> <p>Update in progress...</p> <p>Found script to run before update! ATTENTION</p> <p>Convert timeperiods, nagios-collector and monitor parameters: In NConf 1.3 certain attributes belonging to timeperiods, nagios-collector and nagios-monitor servers have been removed. Please refer to the "Release Notes" for a complete list of these attributes. -> Link to Release Notes</p> <p>If you click "Next", the update process will proceed to remove these attributes. Prior to removing them, you have the chance to "Convert" these parameters into host- and service-templates. That way, the original parameters will still be applied to hosts and services, but it will be done using ordinary Nagios inheritance functionality.</p>	connect to mysql	OK	access database	OK	Executing conflict_check.ini	OK	DB version detected: 1.2.6	OK	update conflict check	OK	<p>Additional manual tasks might be necessary before the database will be update. You can run the conversion script directly from the GUI.</p> <p>Convert data Please read the Release notes [http://www.nconf.org/dokuwiki/doku.php?id=nconf:download:releasenotes] for more information.</p> <p>Be sure you have a DB-backup so if something goes wrong you can go back again...</p> <p>Please post in the Forum [http://forum.nconf.org] if you have any problems here.</p>
connect to mysql	OK										
access database	OK										
Executing conflict_check.ini	OK										
DB version detected: 1.2.6	OK										
update conflict check	OK

Read release notes

<p>Please read the next steps, for updating your configuration</p> <pre>##### ### This is the 1.2.4 to 1.2.5 README file ### #####</pre>	<p>Additional manual tasks might be necessary after an update. Refer to the version-specific README section for update-related instructions. This section contains important instructions about necessary config changes etc. The release notes for the current release can also be found here: Release notes [http://www.nconf.org/dokuwiki/doku.php?id=nconf:download:releasenotes]</p>

Test the new release and try the new features

 <p>The screenshot shows terminal output for 'Generating global config files' and 'Running system check'. The system check table is as follows:</p> <table border="1"> <thead> <tr> <th>Component</th> <th>Total Warnings</th> <th>Total Errors</th> </tr> </thead> <tbody> <tr><td>collector_000</td><td>0</td><td>0</td></tr> <tr><td>collector_010_020</td><td>0</td><td>0</td></tr> <tr><td>collector_030</td><td>0</td><td>0</td></tr> <tr><td>collector_040</td><td>0</td><td>0</td></tr> <tr><td>collector_050</td><td>0</td><td>0</td></tr> <tr><td>collector_060_0</td><td>0</td><td>0</td></tr> <tr><td>collector_060_1</td><td>0</td><td>0</td></tr> <tr><td>collector_070</td><td>0</td><td>0</td></tr> </tbody> </table> <p>Below the table, it says 'Deploy generated config:' followed by a 'Note' box: 'The generated configuration has been written to the "/> </p>	Component	Total Warnings	Total Errors	collector_000	0	0	collector_010_020	0	0	collector_030	0	0	collector_040	0	0	collector_050	0	0	collector_060_0	0	0	collector_060_1	0	0	collector_070	0	0	<p>If everything is fine, try to create your configuration and check the new setup. You could also try to setup the new Deployment possibility. We hope, everything is fine and you enjoy the new version.</p>
Component	Total Warnings	Total Errors																										
collector_000	0	0																										
collector_010_020	0	0																										
collector_030	0	0																										
collector_040	0	0																										
collector_050	0	0																										
collector_060_0	0	0																										
collector_060_1	0	0																										
collector_070	0	0																										

6. Restore icons (optional)

If you were using additional icons prior to the update, you will have to copy these back from your backup folder.

7. Clean up

Finally, remove the following files and directories:

- 1 | INSTALL
- 2 | INSTALL.php
- 3 | UPDATE
- 4 | UPDATE.php

The update should now be complete.

Refresh browser cache:

If NConf does not look or feel right after the update, press **CTRL-F5**. Your browser might have to reload some cached [CSS](#) & JavaScript files.

Manual update (commandline)

1. Backup

Make a backup copy of your whole 'nconf/' folder and create a dump of your 'nconf' database.

The update process will not overwrite your configuration, but if you have made changes to any other files, these changes will be lost! This is also true for icons that you might have installed manually ('img/logos/base/').

Example:

```
1 | cp -rp nconf/ nconf.BAK
2 | mysqldump -u DBUSER -p DBNAME > nconf-dbdump.sql
```

2. Download and unpack

Download and unpack the NConf archive to a temporary location on your webserver.

Example:

```
1 | tar -zxf nconf-VERSION.tgz -C /tmp/
```

3. Update existing files

Copy the unpacked files to the 'nconf/' folder and overwrite any existing files of your current NConf installation.

Example:

```
1 | /bin/cp -rv /tmp/nconf/* /path/to/nconf/ (specify the full path to the 'cp' binary)
```

This step cannot be undone! Make sure you have made a backup of your 'nconf/' folder.

4. Check permissions

Make sure the following directories are still writable to your webserver user:

```
1 | ./config
2 | ./output
3 | ./static_cfg
4 | ./temp
```

5. Update the database

Update 1.2.6 to 1.3.0

Please read first the [release notes](#), before updating your database. Perhaps you need to convert some data before you upgrade NConf!

The 'UPDATE/' folder contains a subfolder for each previous release of NConf. The folders are named like this:

x.x.x_to_y.y.y

Make sure you know your current version of NConf. Next, chose the appropriate folder and look for a script named *update_database_x.x.x_to_y.y.y.sql*.

Update the database like this:

```
1 | $> mysql -u DBUSER -p DBNAME < UPDATE/x.x.x_to_y.y.y/update_database_x.x.x_to_y.y.y
```

If you are updating from an older version of NConf, make sure you apply all available updates for all versions between your version and the latest version of NConf. Also, make sure you apply the updates in the right order!

Important:

make sure you don't skip any updates, and that you apply ALL of them in the right order. Failure to do so may result in data corruption and instability of NConf! If you want to use the convert script, you have to apply it to the 1.2.6 release, before going to 1.3!

6. Additional tasks

Check the version-specific 'README' file within the current subfolder for update-related instructions. If you have applied more than one update, make sure you study all README files in all subfolders. These files contain important instructions about necessary config changes etc.

The release notes for the current release can also be found here: [Release notes \[http://www.nconf.org/dokuwiki/doku.php?id=nconf:download:releasenotes\]](http://www.nconf.org/dokuwiki/doku.php?id=nconf:download:releasenotes)

7. Restore icons (optional)

If you were using additional icons prior to the update, you will have to copy these back from your backup folder.

8. Clean up

Finally, remove the following files and directories:

- 1 | INSTALL
- 2 | INSTALL.php
- 3 | UPDATE
- 4 | UPDATE.php

The update should now be complete.

Refresh browser cache:

If NConf does not look or feel right after the update, push **CTRL-F5**.

Your browser might have to reload some cached [CSS](#) & JavaScript files.
